Hack MSIT – 19

Team - Element X

Government is trying their best in waste management. But problems are still there as government can only provide resources for people to use, but they don't know where to place it. If some people can help them by giving them information regarding their needs then the problem can be solved.

To get that information we will build a simple webapp where people can register themselves and can file complaints regarding the needs. When the registered complaints are high number with different people it will be forwarded to the higher authority.

Complaints that can be register:

1)Toilets - People don't want to build toilet in their house. Public toilet can be built by government to use.

2)Proper Waste Disposal - People only care about cleaning their house not the area. So, they throw garbage anywhere. Placing the garbage bins at places and proper garbage collecting trucks.

3)Health care centers - There are still some place where there is no clinic or hospital for people. If there is a Health care center it maybe is far from them.

4)Street Lights - As there are many street light and it also hard to maintain and check every street light. Complain can register.

5)Roads Repairing - Roads condition also get worse and no one files complain.

more coming soon :)
